## Supplementary tables and figures

Table A. Classification of vascular and nonvascular outcomes in the Reykjavik cohort study using codes from both $9^{\text {th }}$ and $10^{\text {th }}$ revisions of International Classification of Diseases (ICD 9 and 10)

| Outcome | ICD 9 Codes | ICD 10 Codes |
| :---: | :---: | :---: |
| Myocardial infarction | 410, 412 | I21, I22 |
| Other CHD | 411, 414 | I23-I25 |
| Ischaemic stroke | 433, 434 | 163 |
| Subarachnoid haemorrhage (SAH) | 430 | 160 |
| Haemorrhagic stroke (excl. SAH) | 431 | I61 |
| Unclassified stroke | 436 | I64 |
| Other cerebrovascular events (excl. unclassified stroke) | 432, 437, 438 | F01, I62, I65-I69 |
| Other vascular events | $\begin{aligned} & 093,391,393-398,416- \\ & 426,440,442-459,745- \\ & 747 \end{aligned}$ | $\begin{aligned} & \text { I01, I05-I09, I27-I46, I52, } \\ & \text { I70,72-I74, I77-I89, I95- } \\ & \text { I99, Q20-Q28 } \end{aligned}$ |
| Cancers deaths | $\begin{aligned} & 140-141,143-151,155, \\ & 157,160-162,180,188, \\ & 189,205,152-154,156 \\ & 174,175,182,183,185, \\ & 186,193,142,158,159, \\ & 163-173,176-179,181, \\ & 184,187,190-192,194- \\ & 204,206-239 \end{aligned}$ | C00-C06, C09-C16, C22, C25, C30-C34, C64, C53, C65, C67, C92, C17-C21, C23, C24, C50, C54-C56, C61-C62, C73, C07, C08, C26, C37-C49, C51, C52, C57-C60, C63, C66, C68C72, C74-C85, C88-C91, C93-D48 |
| Nonvascular noncancer deaths | $\begin{aligned} & 460-478,490-496,500-519 \\ & 001-066,071-092,094- \\ & 139,480-486,290-359 \\ & 530-579,580-637,001- \\ & 092,094-139,240-390, \\ & 392,454-457,460-487, \\ & 500-744,748-760,779, \\ & 800-999 \end{aligned}$ | J00-J11, J20-J47, J60-J99 A00-B99, J12-J18, F00, F02-F99, G00-G37, G40G44, G46, G47, G50-G99 K00-K67, K70-K77, K80K99, N00-N99, A00-B99, D50-F00, F02-F99, G00G44, G46-I00, I02, I83I86, I88, I89, J00-J39, J60Q18, Q30-Q99, U04-Z99 S00-T98 |
| Unclassified deaths | 780-797, 799 | R00-R95, R98, R99 |

Table B. Baseline correlates of eGFR levels by 4-variable MDRD equation

|  | No of subjects | $\begin{array}{r} \hline \text { Mean (SD) } \\ \text { or } \% \\ \hline \end{array}$ | Pearson correlation r (95\% CI) | Difference ( $95 \%$ CI) in eGFR levels per 1 SD increase or compared to reference category§ | $z$ values§ |
| :---: | :---: | :---: | :---: | :---: | :---: |

Table C. Association of renal function with coronary heart disease and nonvascular mortality (unadjusted analysis)

|  | No. of participants | Coronary Heart Disease (CHD) |  | Nonvascular Mortality |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | No. of events | Crude HR (95\% CI) | No. of events | Crude HR (95\% CI) |
| Participants without chronic kidney disease |  |  |  |  |  |
| eGFR $\geq 90 \mathrm{~mL} / \mathrm{min} / 1.73 \mathrm{~m}^{2}$ | 3,265 | 872 | 1.09 (1.01 to 1.16) | 803 | 1.04 (0.97 to 1.12) |
| eGFR $75-89 \mathrm{~mL} / \mathrm{min} / 1.73 \mathrm{~m}^{2}$ | 6,031 | 1,478 | 1.00 (0.95 to 1.05) | 1,404 | 1.00 (0.95 to 1.05) |
| eGFR $60-74 \mathrm{~mL} / \mathrm{min} / 1.73 \mathrm{~m}^{2}$ | 5,902 | 1,319 | 0.96 (0.91 to 1.02) | 1,346 | 1.05 (1.00 to 1.11) |
| Participants with chronic kidney disease $\dagger$ |  |  |  |  | 1.27 (0.74 to 2.19) |
| Stage 1 (eGFR $\geq 90 \mathrm{~mL} / \mathrm{min} / 1.73 \mathrm{~m}^{2}+$ proteinuria) | 63 | 22 | 1.97 (1.30 to 2.99) | 13 | 1.23 (0.80 to 1.88) |
| Stage 2 (eGFR 60-89 mL/min/1.73m² proteinuria) | 125 | 54 | 2.83 (2.17 to 3.70) | 21 | 1.78 (1.58 to 2.01) |
| Stage 3a (eGFR 45-59 mL/min/1.73m²) | 908 | 240 | 1.50 (1.32 to 1.70) | 258 | 3.86 (2.63 to 5.67) |
| Stage 3b (eGFR 30-44 mL/min/1.73m²) | 63 | 20 | 2.57 (1.66 to 3.98) | 26 | 5.45 (2.04 to 14.51) |
| Stage 4 (eGFR 15-29 mL/min/1.73m ${ }^{2}$ ) | 12 | 5 | 5.80 (2.41 to 13.93) | 4 | 1.04 (0.97 to 1.12) |

Analysis restricted to 16,369 participants with complete information on smoking status, history of diabetes, total cholesterol, triglycerides (log transformed), systolic blood pressure, and body mass index + No participants in this cohort were in stage 5 or kidney failure stage (ie, eGFR $<15 \mathrm{~mL} / \mathrm{min} / 1.73 \mathrm{~m}^{2}$ ).

Table D. Association of renal function* with coronary heart disease and nonvascular mortality

|  | No. of participants | Coronary Heart Disease (CHD) |  |  | Nonvascular Mortality |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Controls, n | 0 | 115 | 1557 | 40 | 115 | 40 |
| $\geq 20 \%$ |  |  |  |  |  |  |
| Cases, n | 0 | 0 | 14 | 110 | 14 | 0 |
| Controls, n | 0 | 0 | 32 | 240 | 32 | 0 |
| Total |  |  |  |  |  |  |
| Cases, n | 159 | 336 | 334 | 124 | 50 | 40 |
| Controls, n | 9073 | 4015 | 1717 | 280 | 306 | 305 |

The model with conventional risk factors (stratified by sex) includes age, smoking status (current vs other), history of diabetes (yes vs no), total cholesterol, systolic blood pressure.

Figure A. Renal function and risk of coronary heat disease and nonvascular mortality

Coronary Heart Disease $(n=4,010)$

Nonvascular mortality ( $n=3,875$ )

$$
\begin{aligned}
& \underbrace{}_{\text {Bottom Fith }}
\end{aligned}
$$

Multivariate regression spline was used to model the exposure association (cubic function, with 3 equally spaced knots placed at $25^{\text {th }}$, $50^{\text {th }}$ and $75^{\text {th }}$ centiles)
Hazard ratios presented are adjusted for age, sex, smoking status, history of diabetes, total cholesterol, triglycerides (log transformed), systolic blood pressure, and body mass index The size of the data markers is proportional to the inverse of the variance of the hazard ratios. CI are calculated using floating-variance Estimated GFR (eGFR) was calculated using the MDRD equation

Figure B. Risk of vascular and nonvascular outcomes in people with chronic kidney disease compared with people without chronic kidney disease, grouped by several individual characteristics

Figure C. Risk of vascular and nonvascular outcomes in people with chronic kidney disease compared with people without chronic kidney disease, excluding events occurring in first five years of follow-up

[^0]Figure D. Hazard ratios for coronary heart disease in people with chronic kidney disease compared with people without, allowing for time-dependent chronic kidney disease status

In the baseline analyses (indicated by red markers) CKD status was defined only according to the baseline measurement. In the other analyses, CKD status was modelled as a time dependent continuous variable to represent the probabiity of having CKD (range between 0 and 1). Participants classified as having CKD kept CKD status of 1 until time of event. For participants with no known CKD, the probability of having CKD was calculated according to the incident rates of CKD (\% per year) based on the cumulative exponential distribution.

[^0]:    Hazard ratios presented are adjusted for age, sex, smoking status, history of diabetes, systolic blood pressure, total cholesterol, log triglycerides and body mass index. The size of the data markers is proportional to the inverse of the variances of the hazard ratios. COPD, chronic obstructive pulmonary disease; estimated GFR (eGFR) was calculated using the MDRD equation
